Video of the Partners – re:edu

Introduction (00:00 – 00:14 sec):

My name is Thomas Bartoschek and I am the CEO of Reedu GmbH & Co. KG.

What are your tasks in the SIMPORT project (00:14 – 00:31 sec)?

We support all project partners with the implementation, especially with the learning app, and are mainly responsible for the dissemination, i.e. the transfer and publication of all project results in various ways.

How would you describe the project in one sentence (00:31 – 00:54 sec)?

In the SIMPORT project, frameworks are being developed to make apps that collect location data from users controllable and easier to understand, so that they know how, when and where data about their location is being recorded and they have control over it.

Why is the SIMPORT project important (00:54 – 01:11 min)?

The SIMPORT project is important because people should have more control over their own location information and better understand who, when, where and what is doing with their data.

What are you working on in the project (01:12 – 01:33 min)?

We are currently developing an app, the openSenseMap app, using technology created in the project to provide control and information about the collection of location data to users. We are also developing new content for the project's website.

What impact will the results of the SIMPORT project have in 5 years (01:34 – 01:56 min)?

I hope that in 5 years time developers will use the products of the project, the frameworks that are being developed here, to enable users to have better control over their own location information and to better understand where it is being used.
